### Database and Tables

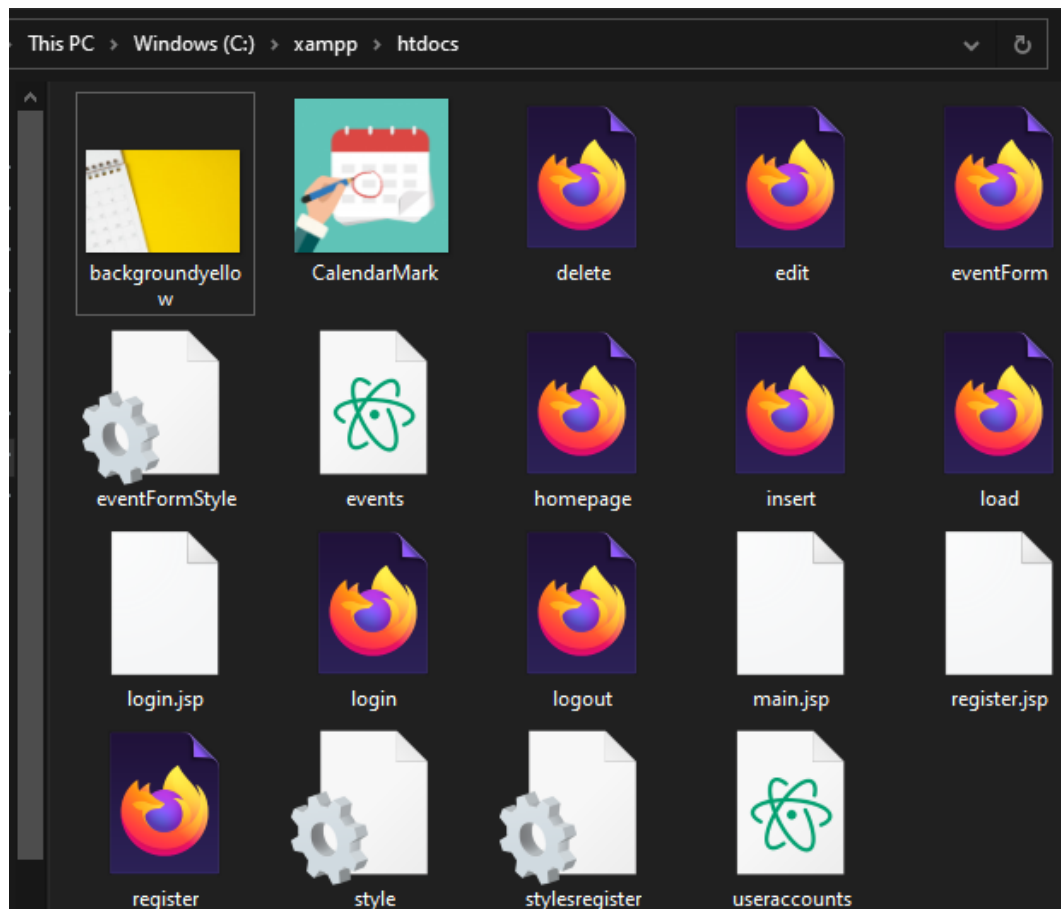

Our database, named “time\_crunch\_planner”, contains two tables- useraccounts and events. In our project files we have included a folder named “Setup” that includes **time\_crunch\_planner.sql**, which when imported should create the database and all associated tables. These SQL files can be imported into phpMyAdmin using xampp with mySQL and Apache turned on.

The time\_crunch\_planner SQL file was set up with some sample users to display the intended format of entries. There are also a couple of events inside the event table. If importing **time\_crunch\_planner.sql** does not work properly, we have also included **useraccounts.sql**, **events.sql**. These SQL files should build each of the tables.

### Files

Our files for this project are all located in the “Final Progress” folder. Please use xampp to access our website after importing our databases. All files should be **directly copied into the htdocs folder**, without being nested within another folder.

### **Running the Program**

With xampp on and running Apache and MySQL, type “localhost” into the browser address bar. The files in htdocs will come up. Click on ‘Login.php’ or ‘Register.php’ to begin.
